PART I

INTRODUCTION AND OBJECTIVES OF THE SURVEY

1. INTRODUCTION

In a country where the economy is predominantly agrarian, agricultural information is essential for policy makers and other users. In this regard, the Central Statistical Authority (CSA) has exerted every effort to provide users and decision makers with reliable and timely agricultural data.

This report presents the 1997/98(1990 E.C.) Agricultural Sample Survey (AgSS) area and production survey results for the major crops produced within the private peasant holdings sector of the economy. The report includes the objectives of this annual survey while outlining: coverage and content of the survey, sample design, field organization, training of field staff, method of data collection, as well as the survey estimates of area, production and yield of major crops. Estimation procedures and formulations for estimates of totals, ratios, and variance are presented in Appendix I. Estimates of the standard errors with the corresponding coefficient of variations for area and production for the major crops, the number of agricultural households covered, parcels and fields measured, and number of crop cuttings completed are presented in Appendix II and Appendix III.

2. OBJECTIVES OF THE SURVEY

The general objective of CSA's Agricultural Sample Survey (AgSS) is to collect basic quantitative information on the country's agriculture that is considered essential for development planning, socio-economic policy formulation, food assistance, etc. The AgSS is composed of four components: a forecast survey, a Meher season survey, a livestock survey, and a survey of the Belg season crop area and production.

The objectives of the Meher season area and production survey and included in this report are estimates of the total cultivated land area and yield per hectare of major crops (temporary). Companion reports are published separately with estimates of land utilization and quantity of agricultural inputs applied by type for the Meher and Belg seasons. A special study was conducted in Harari region designed to provide high precision estimates at the farmer's association level (a one hundred percent sample of primary sampling units at the first-stage of sampling), a sub-sample of sixty-five households at the second-stage, and published as a separate report. In cooperation with the National Fertilizer Industry Agency (N.F.I.A.) the 1997/98 AgSS incorporated additional data collection for making baseline estimates of fertilizer usage which are being published also in a separate report. All reports are based on the private peasant holdings in sedentary areas of the nation, further subdivided by regions and zones.

PART II

SURVEY METHODOLOGY, DATA COLLECTION AND PROCESSING

1. SCOPE, COVERAGE AND CONTENT OF THE SURVEY.

The 1997/98 (1990 E.C.) annual Agricultural Sample Survey used a sampling frame which was designed to cover the sedentary rural agricultural population in all regions of the country (urban and nomadic areas were not included in the survey). Illustrated in Table A is a break down of the sample distribution as expressed by regions, zones and weredas. A total of 56 zones and 409 weredas were actually covered by the survey.

The lowest level sampling unit used for this survey is defined as an enumeration area (EA) as identified for the 1994 Population Census. For the 1997/98 AgSS a total of 1380 enumeration areas were selected from all regions of the country. Due to various reasons, 31 of them were incompletely enumerated which resulted in the survey actually covering 1349 enumeration areas (EAs). From each of the selected EAs a representative sample of 40 agricultural households were selected to represent the agricultural population of the sampled EA.

Of these 40 agricultural households, the first 25 were used for obtaining information on area under crops, Meher and Belg season production of crops, land utilization, agricultural practices, crop damage, and quantity of agricultural inputs used. It is important to note that of the total 40 agricultural households sampled in the selected EAs, data on crop cutting were collected for only the 15 households (11th -25th households selected).

Table A. AREAL COVERAGE OF THE 1997/98 AGRICULTURAL SAMPLE SURVEY

REGION	NUMBER OF ZONES			NUMBER OF WEREDAS	
	TOTAL	ZONES SAMPLED FOR THE SURVEY	N O T COVERED BY THE SURVEY	SAMPLED FOR THE SURVEY	ACTUAL NUMBER OF WEREDAS COVERED BY THE SURVEY
TIGRAY	4	4	-	34	31
AFAR ¹	5	3	2	8	7
AMHARA	11	10	1	93	92
OROMIYA	12	12	-	174	171
SOMALIE ²	9	3	6	9	9

A. ABABA ³	6	2	4	5	5
DIRE DAWA	1	1	-	1	1
TOTAL	70	56	14	424	409

Note

- 1 - Afar region has a total of five zones, but only three zones have significant sedentary rural population.
- 2 - Somalie region has a total of nine zones, however only three zones have significant sedentary rural population.
- 3 - Addis Ababa has a total of six zones, however, only two zones have rural settled population. In the remaining four zones the entire population is urban residents.

S.N.N.P.R = Southern Nations and Nationalities Peoples' Region

2. CONCEPTS AND DEFINITIONS.

In order to collect standardized data of acceptable quality the same concepts and definitions must be used by all field enumerators during data collection. Below are defined some of the more important concepts and definitions used for the survey:

Enumeration Area (EA): An enumeration area in rural parts of the country is a locality that is less than or equal to a farmer's association in geographical area and usually consists of 150 - 200 households.

Holder: A holder is a person who exercises management control over the operations of the agricultural holding and makes the major decision regarding the utilization of the available resources. He has primary technical and economic responsibility for the holding. He may operate the holding directly as an owner or as a manager. Under conditions of traditional agricultural holding the holder may be regarded as the person, who with or without the help of others, operates land or raises livestock in his own right, i.e. the person who decides on what, when, where and how to grow crops or raise livestock and has the right to determine the utilization of the products.

Holding: a holding is all the land and/or livestock kept which is used wholly or partly for agricultural production and is operated as one legal entity by one person alone, or with others without regard to management, organization, size or location.

Household: A household may be either;

a) a one person household, that is a person who makes provisions for his own living without combining with any other person to form part of a multi-person household or

b) a multi-person household, that is, a group of two or more persons who live together and make common provisions for food or other essentials of living. The persons in the group may pool their incomes and have a common budget to greater or lesser extent. They may be related or unrelated persons, or a combination of both. These persons are taken as members of the household.

Agricultural household: A household is considered an agricultural household when at least one member of the household is engaged in growing crops and/or breeding and raising livestock in private or in combination with others.

Parcel: A parcel of holding is any piece of land entirely surrounded by land, water, road, forest, ...etc. which is not part of the holding. It may consist of one or more cadastral units, plots or fields adjacent to each other.

Field: A field is defined as any plot of land which is a parcel or part of a parcel under the same or mixed crops..

Meher(Main) Season Crop: Any crop harvested from Meskerem (September) to Yekatit (February) is considered as Meher season crop.

Belg Season Crop: any crop harvested during the months of March (Megabit) to August (Nehase).

Temporary Crops: Temporary crops are crops which are grown under a cycle of less than one year, sometimes only a few months with an objective to be sown or replanted again for additional production following the current harvest. Continuously grown crops planted in rotation are also considered temporary crops since each is harvested and destroyed by ploughing in preparation for each successive crop.

Permanent Crops: Crops which are grown and occupy land for a long period of time, not requiring replanting for several years after each harvest, are considered permanent crops. All fruit trees (i.e. oranges, mandarin, banana, etc.) and trees for beverages (i.e. coffee, tea, etc.) are considered permanent crops, but meadows and pastures are excluded.

3. SAMPLE DESIGN.

A two-stage stratified sample design is used for the 1997/98 (1990 E.C.) Annual Agricultural Sample Survey. All regions except Harari, Addis Ababa, Dire Dawa and Gambella are broken into zones and treated as strata/reporting levels for survey summarization purposes, but for the four mentioned regions, the

reporting levels are the regions themselves. The sample design first-stage consists of primary sampling units (PSUs) in all strata which are enumeration areas (EAs). The second-stage sampling units are agricultural households selected as the secondary level sampling units. The survey questionnaires are administered to all agricultural holders in the sampled agricultural households.

Based on cost and field enumeration considerations, a fixed number of sample EAs were allocated to each stratum/ reporting level taking into consideration the desired precision of the estimates and number of households per stratum. The overall sample number of EAs in a stratum was proportionately allocated to zones/special weredas within stratum based on their number of households. From within each Zone/Special Wereda sample EAs were selected with probability proportional to size, size being the total number of households identified for EAs as obtained from the 1994 Population Census. From each sample EA, 40 agricultural households were sampled systematically without replacement from a newly enumerated list of agricultural households of which the first 25 agricultural households were used to obtain information on crop planted area and crop production of both the Meher and Belg seasons. However, livestock information was collected from the full sample of 40 selected agricultural households.

Information was collected from all twenty-five households except for crop-cutting data which is collected from only the last 15 agricultural households, starting from the 11th selected agricultural households. Data is collected on separate questionnaires from each holder within these twenty-five sampled households.

The estimation formulation procedures for totals and ratios of the agricultural variables estimated and the measure of precision for area and production are presented in *Appendix I and II*.

4. FIELD ORGANIZATION.

CSA Branch Statistical Office heads, field supervisors and enumerators, other support staff and drivers were all involved in the conduct of the AgSS area and production survey data collection effort. To accomplish the data collection all field enumerators were equipped with the necessary survey equipment (i.e. compass, protractor, ruler, measuring tape, balance scale, poles, ropes, sample bags,...etc.) at the completion of training. To assist with the field work and data collection activities all available four-wheel drive vehicles were used for supervision and collection of completed questionnaires.

5. TRAINING OF FIELD STAFF.

The field staff training program was carried out in two stages. The first-stage consisted of trainees from the head office, Branch Statistical Office heads and some of the field supervisors being given training for one week at CSA's headquarters complex in Addis Ababa. Many of those trained in the first-stage conducted similar training for field supervisors and enumerators for 10 days in all of CSA's 15 branch offices which are distributed around the country. During this second-stage training, the field staff were given detailed classroom instruction on the objectives and uses of the AgSS, concepts and definitions of terms used, the method of area measurement, method of crop cutting, as well as correct

interviewing procedures,... etc. The enumerators' training also included a field practice to reinforce the concepts discussed in the classroom with regard to field measurement and crop cutting data collection.

6. METHOD OF DATA COLLECTION.

Data for the AgSS area and production survey were recorded on questionnaires using both subjective and objective enumeration methods. Information on agricultural practices (application of fertilizer, pesticide, use of improved seeds and irrigation) were collected subjectively by interviewing the holders located in each sampled household.

The objective measurement procedures for area measurements were carried out for the 25 selected households from each sampled EA. This required that all separate fields by land area utilization be physically measured using compass and measuring tape. In addition, for all fields under temporary crops of each holder of the last 15 sampled households, each was classified by type of crop and for selected major crops a field was randomly selected for each crop for crop cutting to be performed. Crop cutting procedures consist of demarcation of a sixteen meter square plot randomly located in the selected field for which the crop in the field is to be harvested. Following the field enumerator's harvest of the crop cutting plot and threshing, the crop is stored in bags with identification information (i.e. name of the crop, holder number, parcel and field number). The crop placed in the bag is weighed immediately (green weight) after threshing, and weighed again after two weeks of drying to simulate normal holder harvesting and drying practices. The green and dry weights are recorded on the respective questionnaire.

7. DATA PROCESSING

a. EDITING, CODING AND VERIFICATION.

To insure the quality of the collected survey data an editing, coding and verification instruction manual was written, and sixty-five editors, coders and verifiers were trained for two days to edit, code and verify the data using the forementioned manual as a reference and teaching aid.

The enumerator completed questionnaires were edited, coded and later verified by supervisors on a 100% basis before the questionnaires were sent to the data processing unit for data entry. The editing, coding and verification of all questionnaires was completed in thirty eight days.

b. DATA ENTRY, CLEANING AND TABULATION.

Before starting data entry professional staff of Agricultural Statistics Department of Central Statistical Authority prepared edit specifications for use on personal computers utilizing the Integrated Microcomputer Processing System (IMPS) software for data consistency checking purposes.

The data on the coded questionnaires were then entered into the IMPS software on personal computers. The data was then checked and cleaned using the edit specifications prepared earlier for this purpose. Thirty data encoders were involved in this total process and it took thirty-three days to complete the job. Finally, tabulation was done on personal computers to produce results as indicated in the tabulation plan.

PART III

SUMMARY OF THE SURVEY RESULTS

1. AREA AND PRODUCTION

The result for area, production and yield of major crops (temporary or annual) is presented in this publication. The twenty major crops estimated exclude cash crops (coffee, chat,...etc.) , fruits, vegetables, enset and other root crops. Consequently, the total area under major temporary crops is estimated to be about 6.8 million hectares (See Table B) at national level for the Meher season of 1997/98 (1990 E.C.).

Out of the total crop area, cereals accounted for about 5.6 million hectares (81.79%), while pulses and other crops (like neug, linseed, rapeseed, ground nuts, sunflower, sesame and fenugreek) accounted for 0.84 million hectares (12.23%) and 0.41 million hectares (5.99%), respectively.

Looking at specific crops, the largest area, or about 1.75 million hectares, is reported for teff followed by maize and sorghum. For details refer to Table 1.

Table B. Summary of Area, Production and Yield of Major Crops for the year 1997/98 (1990 E.C.)

Type of crop	Area in million hectares		Production in million quintals		Yield per hectare
	Number	Percent	Number	Percent	
CEREALS	5.60	81.79	64.99	88.27	11.60
PULSES	0.84	12.23	6.80	9.24	8.12
OTHER CROPS	0.41	5.99	1.84	2.49	4.48
TOTAL	6.85	100.00	73.63	100.00	10.75

The total production estimate at the national level is about 73.63 million quintals, of which cereals accounted for 64.99 million quintals, pulses accounted for about 6.80 million quintals, and other crops (mentioned above) totalled to 1.84 million quintals (See Table B).

The survey results also indicate that the yield of cereals was 11.60 quintals per hectare, the yield of pulses was 8.12 quintals per hectare and the yield of other crops (mentioned above) was 4.48 quintals per hectare. In Table 1 it is also shown that the highest yield is reported for maize, which was 17.53 quintals per hectare, and the lowest is for nueg, and sunflower at 3.77 quintals each per hectare.

As presented in Table 2, total area cultivated, total production, and the average yield per hectare have decreased by 15.15%, 23.67% and 10.05 %, respectively compared to last crop season, i.e. 1996/97.

Table 1. Estimates of Area, Production and Yield of Major Crops for Private Peasant Holdings 1997/98 (1990 E.C.)

The 1997/98 AgSS sample design increased the number of sampling units to produce more accurate survey estimates at the regional and zonal levels. Comparing the AgSS estimates at the regional level the data in Table 3 illustrates the diversity of Ethiopian agricultural production.

In the Tigray Region, 514 thousand hectares of land have been allotted to grow the twenty major crops by private holders in 1997/98, an increase of 7% from the previous year. Production of the twenty major crops was down by 22% compared to 1996/97. The 1997/98 estimate of total major crop production of Tigray Region accounted for 6.25% of the total national crop production. Production was down due to adverse weather with crop damage causing the yield at 8.95 qt/ha which is a decline of 27% compared with that of the previous year. The land area under the 20 major crops constitute 7.5 % of the total land area under similar crops at country level.

In the Afar Region 16 thousand hectares of land were cultivated in order to grow the twenty major crops by private holders in 1997/98. The production showed a decrease of 47% from the previous year. Production of the twenty major crops was down by 71% compared to 1996/97 and accounted for only 0.02% of the total crop production at country level. Production was down due to adverse weather with crop damage causing the yield at 7.27 qt/ha which is a decline of 45% compared with that of the previous year.

The Amhara region is the second largest in both area planted and production in 1997/98 with 2.5 million hectares of land cultivated for growing the twenty major crops by private holders. This indicated a decrease of 20% from the previous year. This area accounted for 36% of the national total area planted.

Table 3.

Production of the twenty major crops was down 31% from 1996/97 and nearly this production accounted for 30% of the crop production at country level. Production was down due to adverse weather with crop damage causing the yield at 8.86 qt/ha to decline 13% from the previous year.

The Oromiya Region is the largest in both area planted and production in 1997/98 and 3.1 million hectares of land were cultivated to grow the twenty major crops by private holders. This shows a decrease of 15% from the previous year. This area comprised 45% of the total crop area at country level and accounts for over half (51%) of the total crop production, at country level. The production in Oromiya of the twenty major crops was down by 21% compared to 1996/97. Whereas weather damage was pervasive in most of the major growing regions, this lower production was partly due to a reduction in planted area and partly due to crop damage causing the yield at 12.17 qt/ha which is a decline of 13% compared with that of the previous year.

Somali and Benshangule-Gumez Regions both showed an increase in planted area of 21% and 1.1 %, respectively compared with 1996/97. These two regions and Gambela Region have shown substantial increase in production this year. This observed increase was due to a combination of increased area planted and higher yield compared with the previous year.

The S.N.N.P. Region cultivated 552 thousand hectares of land and is the third largest major crop-growing region in the country, accounting for 8% of the total area planted at country level compared with 1996/97. This planted area estimate decreased by 17%.

The three remaining Regions of Harari, Addis Ababa, and Dire Dawa experienced similar reductions in planted area, down by 26%, 28%, and 20%, respectively compared with 1996/97 Meher crop year. Yield was reduced by 23% in Harari and 36% in Dire Dawa compared with that of the previous year. Detailed estimates at regional as well as zonal level are given in Tables 4 through 14.

NOTE

1. Some estimates in all reporting levels are excluded due to high coefficient of variations. Nevertheless, they are incorporated in the total estimates. Hence, the sum of the specific estimates may not be equal to the total estimates.
2. Users are also advised to use those estimates with 30 - 50 % coefficient of variation (CV) with caution.
3. Eventhough area is reported for some crops at some reporting levels, when no production data is available in such cases they are designated as "NS", meaning not stated.
4. For those items in the table where a "*" appears, it implies that no data was obtained from the sample units from which an estimate could be made.

2. SPECIAL SUMMARY OF CROP DAMAGE ASSESSMENT

This report is the first of its kind dealing with the summary of crop damage estimates in the series of area and production reports of the Annual Agricultural Sample Surveys' ever published.

Information on the type and extent/amount of crop damage is collected subjectively by interviewing holders in the sampled agricultural households. The interview focused on each of the holders' fields sampled for crop cutting exercise on which 4m x 4m plot is demarcated and the crop in the plot is harvested. The yield obtained from these sampled plots are used to estimate production by type of crop at the desired reporting levels. Similarly, the type and the extent of crop damage information was collected from sampled fields of crop cutting exercise plots and used to estimate the extent of crop damage by type at national level. In this year's area and production report, CSA supplements the section on special summary of crop damage to illustrate the reasons for the unusual lower yield and/or production of the 1997/98 (1990 E.C.) Meher season crop harvest.

Hence, an attempt has been made to summarize crop damage estimates by type at national level for five selected cereal crops (namely, Teff, Wheat, Barley, Maize and Sorghum), all other crops combined and for the total of all crops. The objective of summarizing the crop damage estimates is mainly to illustrate the poor performance of this year's meher season crop harvest by investigating yield estimates of damaged area by type of damage and crops affected; and by comparing the effect of the damage on the estimated yield and/or production obtained from damaged area, with that of undamaged area of the same year as well as that of the last year's overall estimates.

The data in Table 3.1 show the impact of the crop damage on the 1997/98 (1990 E.C.) estimates of area, production and yield of all major crops. As it is indicated in the table, of the total area under all crops of this year Meher season harvest, it is reported that 33% of the total area under all crops was damaged due to "too much rain", while additional 13 % of the total area was damaged due to "Shortage of rain". On the other hand, damage caused by "insects and pests" has reduced all crop yield estimate from 12.40 qt/ha on undamaged crop area to 9.19 qt/ha (26 %). Similarly, damage due to "shortage of rain", "too much rain" and "others" have reduced all crop yield estimate by 3.33 qt/ha (27%), 2.32 qt/ha (19%) and 2.07 qt/ha (17 %), respectively. It should be noted that only 34 % of the total area, which accounts for 39 % of the total crop production of 1997/98 (1990 E.C.) is reported to be free from any type of crop damage.

Hence, the overall crop damage on this year production has lowered all crop yield estimate by 10 % when compared with that of 1996/97 (1989 E.C.) estimate. This lower yield estimate of all crops was mainly attributed due to crop damage caused by "too much rain", "shortage of rain" and "insect and pest infection" that prevailed in different parts of the country.

TABLE 3.1. ESTIMATES OF AREA, PRODUCTION AND YIELD FOR ALL CROPS BY CATEGORIES OF CROP DAMAGE FOR PRIVATE HOLDINGS 1997/98 (1990 E.C.)

CROP	REASON FOR CROP DAMAGE	AREA ('000 HA)	%	PRODUCTION ('000 QT)	%	YIELD ('000QT/HA)	% CHANGE FROM NO DAMAGE
All crops	No damage	2335.40	34.10	28954.12	39.33	12.40	-
	Insect & pests	237.15	3.46	2179.21	2.96	9.19	-25.88
	Shortage of rain	891.32	13.01	8087.49	10.98	9.07	-26.81
	Too much rain	2256.56	32.94	22744.84	30.89	10.08	-18.70
	Others	1129.07	16.48	11661.05	15.84	10.33	-16.70
	Total	6849.50	100.0	73626.71	100.0	10.75	-

Furthermore, among the five major cereal crops Teff is hard hit by the unfavorable weather conditions that prevailed during the 1997/98 (1990 E.C.) Meher season. For instance, out of the total Teff area, nearly half, i.e. 49 % of the total area was damaged due to "too much rain", while the damage by "shortage of rain" has affected the area under Teff crop by 12 %. Only 21 % of the total area under Teff crop, however, reported undamaged.

Consequently, the Teff yield estimate obtained from the damaged area due to "shortage of rain" has nearly reduced the yield by about half, i.e. (46%), while 2.48 qt/ha (25 %) reduction of Teff yield was observed in area damaged due to "too much rain" compared to the undamaged area of Teff yield estimate (For the detail see Table 3.2).

As a result of the above mentioned damages caused by unfavourable weather conditions of the 1997/98 (1990 E.C.) crop year, the overall teff yield estimate has been lowered by 21 % when compared with that of 1996/97 (1989 E.C.) estimate. Nevertheless, yield estimate of teff from undamaged area which is 9.73 qt/ha, is up by 5 % from that of last year's estimate.

TABLE 3.2 ESTIMATES OF AREA, PRODUCTION AND YIELD FOR TEFF BY CATAGORIES OF CROP DAMAGE FOR PRIVATE HOLDINGS 1997/98 (1990 E.C.)

CROP	REASON FOR CROP DAMAGE	AREA ('000 HA)	%	PRODUCTION ('000 QT)	%	YIELD ('000QT/HA)	% CHANGE FROM NO DAMAGE
Teff	No damage	370.92	21.23	3608.03	27.60	9.73	-
	Insect & pests	29.12	1.67	217.90	1.67	7.48	-23.07
	Shortage of rain	212.73	12.18	1111.41	8.50	5.22	-46.29
	Too much rain	856.87	49.05	6208.09	47.49	7.25	-25.22
	Others	277.36	15.88	1928.06	14.75	6.95	-28.54
	Total	1747.00	100.0	13073.49	100.0	7.40	-

Wheat and barley are also affected by the unfavorable weather condition that prevailed in 1997/98 (1990 E.C.) Meher season harvest. Data in Table 3.3 present the impact of crop damage on the area, production and yield of wheat and barley in 1997/98 (1990 E.C.). As it is shown in the table, out of the total area under wheat and barley, 29 % and 36%, respectively are affected by "too much rain". As a result of this damage, the yield estimate is lowered by 4% for wheat and 1 % for barley when compared with that of yield estimates obtained from the undamaged area of these two cereal crops (Table 3.3).

On the other hand, yield estimates of wheat and barley obtained from the undamaged area under these crops, i.e. (44% of the total area under wheat and 39% of barley) are higher by 15% for wheat and 13% for barley compared with that of 1996/97 (1989 E.C.) yield estimates of these crops, respectively.

TABLE 3.3 ESTIMATES OF AREA, PRODUCTION AND YIELD FOR BARLEY AND WHEAT BY CATEGORIES OF CROP DAMAGE FOR PRIVATE HOLDINGS 1997/98 (1990 E.C.)

CROP	REASON FOR CROP DAMAGE	AREA ('000 HA)	%	PRODUCTION ('000 QT)	%	YIELD ('000 QT/HA)	% change from no damage
Barley	No damage	301.61	44.23	3679.28	46.79	12.20	-
	Insect & pests	7.93	1.16	87.10	1.11	10.98	-9.96
	Shortage of rain	73.27	10.74	651.03	8.28	8.89	-27.16
	Too much rain	200.10	29.34	2410.71	30.66	12.05	-1.24
	Others	99.04	14.52	1035.83	13.17	10.46	-14.26
	Total	681.95	100.00	7863.95	100.00	11.53	-
Wheat	No damage	306.43	38.90	4490.84	40.58	14.66	-

	Too much rain	280.96	35.67	3963.30	35.81	14.11	-3.75
	Others	120.43	15.29	1643.14	14.85	13.64	-6.90
	Total	787.73	100.00	11067.85	100.00	14.00	-

Maize and Sorghum are the other two crops affected by the unusual weather conditions of the 1997/98 (1990 E.C.). As it is indicated in Table 3.4, approximately one third of the total area under each of these crops remained undamaged (i.e. 37 % and 38 % of the total area under maize and sorghum,

respectively). Moreover, as a result of crop damage caused by "shortage of rain" 18 % of area under Maize and 21 % of area under sorghum were severely affected. Likewise, the yield estimates of both crops have reduced by 4.25 qt/ha (i.e. 22 % and 33 % reduction of Maize and Sorghum yield, respectively) compared to the undamaged area yield estimates. Moreover, the damage caused by "too much rain" has also affected 22 % of the total area under Maize and Sorghum crops, however, it didn't affect the yield estimate of Maize, but reduced the yield of Sorghum by 12 %.

TABLE 3.4 ESTIMATES OF AREA, PRODUCTION AND YIELD FOR MAIZE AND SORGHUM BY CATAGORIES OF CROP DAMAGE FOR PRIVATE HOLDINGS 1997/98 (1990 E.C.)

CROP	REASON FOR CROP DAMAGE	AREA ('000 HA)	%	PRODUCTION ('000 QT)	%	YIELD ('000 QT/HA)	% CHANGE FORM NO DAMAGE
Maize	No damage	397.21	36.09	7511.66	38.94	18.91	-
	Insect & pests	37.30	3.39	492.51	2.55	13.20	-30.18
	Shortage of rain	194.71	17.69	2853.58	14.79	14.66	-22.50
	Too much rain	244.88	22.25	4646.31	24.09	18.97	0.33
	Others	226.50	20.58	3784.46	19.62	16.71	-11.65
	Total	1100.60	100.00	19288.52	100.00	17.52	-
Sorghum	No damage	355.70	37.26	4572.84	42.75	12.86	-
	Insect & pests	50.36	5.27	520.44	4.87	10.33	-19.61
	Shortage of rain	200.24	20.97	1723.74	16.11	8.61	-33.04
	Too much rain	205.77	21.55	2325.74	21.74	11.30	-12.08
	Others	142.68	14.94	1554.64	14.53	10.90	-15.25
	Total	954.75	100.00	10697.40	100.00	11.20	-

For other crops, the main damage is caused by "too much rain" which affected close to half a million hectares or 30% of the total area under these crops. Consequently, the damage caused by "too much rain" has also lowered the yield estimates of these crop by 1.34 qt/ha (16 %) from the yield estimates obtained on the undamaged area.

TABLE 3.5 ESTIMATES OF AREA, PRODUCTION AND YIELD FOR OTHER CROPS BY CATAGORIES OF CROP DAMAGE FOR PRIVATE HOLDINGS 1997/98 (1990 E.C.)

1971

APPENDIX I

ESTIMATION PROCEDURES OF TOTAL, RATIO AND SAMPLING ERRORS.

The following formulas were used to estimate total area of land under specific crop, level of production and yield of specific crop in a given stratum.

1. For estimating total area of land under specific crop:

$$\hat{A}_h = \sum_{i=1}^{n_h} W_{hi} a_{hi}$$

in which

$$W_{hi} = \frac{N_h M_{hi}}{n_h N_{hi} m_{hi}}$$

is the weight.

where

h represents the stratum.

n_h is the total number of EAs selected in h^{th} stratum.

N_h is the measure of size of the h^{th} stratum obtained from the sampling frame.

N_{hi} is the measure of size of the i^{th} sample EA in the h^{th} stratum obtained from the sampling frame.

M_{hi} is the total number of agricultural households of the i^{th} sample EA in the h^{th} stratum obtained from households listing of the survey.

m_{hi} is number of sample agricultural households of the i^{th} sample EA in the h^{th} stratum.

a_{hi} is the sample total of values of area in the i^{th} EA in the h^{th} stratum under a specific crop.

\hat{A}_h is estimate of total area under specific crop in the h^{th} stratum.

2. For estimating level of production :

$$\hat{P}_h = \sum_{i=1}^{n_h} W_{hi} p_{hi}$$

in which

$$p_{hi} = \bar{a}_{hi} \times \bar{y}_{hi}$$

where

$$\bar{a}_{hi} = \frac{a_{hi}}{m_{hi}}, \bar{y}_{hi} = \frac{Y_{hi}}{16c_{hi}}$$

Note: W_{hi} is as defined above.

where

Y_{hi} is sample total of yield of a specific crop from 16 m² area of land for crop-cutting of crop in the ith EA in the hth stratum.

c_{hi} is number of crop-cuttings of a specific crop in the ith EA in the hth stratum.

a_{hi} is sample average area per agricultural household under specific crop in the ith EA in the hth stratum

y_{hi} is average yield per square meter of a specific crop in the ith EA in the hth stratum.

P_{hi} is estimate of production quantity per household of a specific crop in the ith EA in the hth stratum.

P_h is estimate of total production quantity of a specific crop in the hth stratum.

3. Estimate of yield of a specific crop is given by:

$$\hat{Y}_h = \frac{\hat{P}_h}{\hat{A}_h}$$

4. Sampling Variance of Estimates:

Sampling variance of estimate of stratum total of area, production and yield for a specific crop are estimated by the following formulas, respectively.

$$\text{Var}(\hat{A}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \hat{A}_{hi}^2 - \frac{\hat{A}_h^2}{n_h} \right]$$

$$\text{Var}(\hat{P}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \hat{P}_{hi}^2 - \frac{\hat{P}_h^2}{n_h} \right]$$

$$\text{Var}(\hat{Y}_h) = \frac{1}{\hat{A}_h^2} \left[\text{Var}(\hat{P}_h) + \hat{Y}_h^2 \text{Var}(\hat{A}_h) - 2\hat{Y}_h \text{Cov}(\hat{P}_h, \hat{A}_h) \right]$$

where

$$\text{Cov}(\hat{P}_h, \hat{A}_h) = \frac{n_h}{n_h - 1} \left[\sum_{i=1}^{n_h} \left(\hat{A}_{hi} - \frac{\hat{A}_h}{n_h} \right) \left(\hat{P}_{hi} - \frac{\hat{P}_h}{n_h} \right) \right]$$

In estimating the sampling variance by the above formula, selection of EAs within a stratum is assumed to be with replacement. By so doing the variance estimate may be slightly over estimated but it greatly simplify the estimation procedure. Further more the finite population correction (fpc) is ignored in the formula. This is due to the fact that its effect is negligible.

5. Coefficient of Variation (CV) of estimates:

Coefficient of Variation (CV) in percentage of estimate of stratum total of area, production and yield for a specific crop are given respectively by:

$$CV(\hat{A}_h) = \frac{\sqrt{\text{Var}(A_h)}}{\hat{A}_h} \times 100$$

$$CV(\hat{P}_h) = \frac{\sqrt{\text{Var}(P_h)}}{\hat{P}_h} \times 100$$

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that proper record-keeping is essential for financial transparency and accountability. This section also outlines the various methods used to collect and analyze data, ensuring that the information is reliable and up-to-date.

2. The second part of the document details the specific procedures for data collection and analysis. It describes how data is gathered from various sources, including surveys, interviews, and secondary sources. The analysis process involves identifying trends, patterns, and correlations within the data, which helps in understanding the underlying factors influencing the outcomes.

3. The third part of the document focuses on the interpretation of the results. It explains how the collected data is used to draw meaningful conclusions and make informed decisions. This section also discusses the limitations of the study and the potential for future research to build upon the findings.

4. The final part of the document provides a summary of the key findings and their implications. It highlights the main insights gained from the study and offers practical recommendations based on the results. The document concludes by emphasizing the importance of ongoing monitoring and evaluation to ensure that the findings remain relevant and applicable over time.

APPENDIX III

- NUMBER OF EAs SAMPLED AND COVERED
- NUMBER OF HOUSEHOLDS EXPECTED TO BE COVERED AND ACTUALLY COVERED
- NUMBER OF PARCELS AND FIELDS MEASURED
- NUMBER OF CROP-CUTTINGS CONDUCTED
